Aphagia Due to Esophageal Candidiasis in an Immunocompetent Patient

Afagia por candidiasis esofágica en paciente inmunocompetente

José Ruiz Pardo, * Luisa F. Martínez de Haro, Angeles Ortiz Escandell, Vicente Munitiz Ruiz

Servicio de Cirugía General y del Aparato Digestivo, Hospital Clínico Universitario Virgen de la Arrixaca, El Palmar, Murcia, Spain

The patient is a 75-year-old immunocompetent male who had been diagnosed with esophagitis due to Candida glabrata after cardiac surgery 5 years earlier. After receiving treatment with several different antifungal medications with no results, he was referred to our unit due to aphagia. Barium swallow study showed nodular thickening, irregular surface and ulcerous craters in the mucosa of the distal third of the esophagus. Esophagogastroscopey with biopsy revealed stenosis in the distal third of the esophagus with a fungal appearance. After having ruled out malignancy, percutaneous gastrostomy was used to avoid patient malnutrition (Fig. 1).
